space between the tubes.

CLAIM AMENDMENTS

- (currently amended) A transport/storage container 1 for heat-generating nuclear-fuel elements, the container 2 comprising: 3 spaced metallic inner and outer side walls defining between the walls an annular outer space extending along an axis 5 and having upper and lower ends and an inner space within the inner wall, the inner space being adapted to hold the nuclear-fuel elements; a cover at the upper end closing the outer space; a floor at the lower end closing the outer space; 10 a plurality of axially extending, axially open and 11 radially closed, and angularly spaced heat-conducting metal tubes 12 each having an inner wall section bearing with radial inward 13 prestress in surface contact on an outer surface of the inner side 14 wall and an outer wall section bearing with radial outward 15 prestress in surface contact on an inner surface of the outer side 16 wall: 17
- 2. (original) The transport/storage container defined in claim 1 wherein the tubes have radially extending wall sections that are elastically deformed.

a filler mass [[in]] substantially filling the outer

3. (canceled)

- 4. (original) The transport/storage container defined in claim 1 wherein the tubes are of quadrilateral cross section.
- 5. (currently amended) The transport/storage container defined in claim 1 wherein each tube extends generally a full axial length of the <u>outer space</u>.
- 6. (original) The transport/storage container defined in claim 1 wherein each of the inner and outer wall sections has a curvature complementary to a curvature of the respective inner and outer side wall.
- 7. (currently amended) The transport/storage container
 defined in claim 1 wherein the tubes are angularly equispaced, the
 container further comprising A transport/storage container for
 heat-generating nuclear-fuel elements, the container comprising:
 spaced inner and outer side walls defining an annular
 space extending along an axis and having upper and lower ends;
 - a cover at the upper end;
- a floor at the lower end;
- a plurality of axially extending and angularly equispaced
 heat-conducting metal tubes each having an inner wall section

- bearing in surface contact on an outer surface of the inner side
- wall and an outer wall section bearing in surface contact on an
- inner surface of the outer side wall;
- <u>a filler mass in the space; and</u>
- axially extending and angularly spaced spacer strips
 fixed to the outer surface of the inner wall between the tubes.
- 8. (original) The transport/storage container defined in claim 1 wherein the tubes are of generally rectangular section.
- 9. (currently amended) The transport/storage container
 defined in claim 1 wherein A transport/storage container for heatgenerating nuclear-fuel elements, the container comprising:
- spaced inner and outer side walls defining an annular

 space extending along an axis and having upper and lower ends;
 - a cover at the upper end;
- a floor at the lower end;
- a plurality of axially extending and angularly spaced
- heat-conducting metal tubes each having an inner wall section
- bearing in surface contact on an outer surface of the inner side
- wall and an outer wall section bearing in surface contact on an
- inner surface of the outer side wall, the inner and outer surfaces
- [[have]] <u>having</u> a release-agent coating;
- a filler mass in the space.

18 .

19

20

21

- 10. (original) The transport/storage container defined 2 in claim 9 wherein the coating is an epoxy lacquer.
- 11. (currently amended) The transport/storage container

 defined in claim 1 wherein the floor comprises A transport/storage

 container for heat-generating nuclear-fuel elements, the container

 comprising:
 - spaced inner and outer side walls defining an annular
 space extending along an axis and having upper and lower ends;
 a cover at the upper end;
- a floor at the lower end and comprising an inner floor panel and an outer floor panel spaced axially therefrom [[and]];
- a plurality of axially extending and angularly spaced

 heat-conducting metal tubes each having an inner wall section

 bearing in surface contact on an outer surface of the inner side

 wall and an outer wall section bearing in surface contact on an

 inner surface of the outer side wall, the tubes each [[have]]

 having a pair of generally radially and axially extending wall

 sections; , the container further comprising:
 - L-shaped connector strips each having one end fixed to an outer surface of the inner floor panel and an opposite end; and respective clips securing the opposite ends to the radially extending wall sections of the tubes; and a filler mass in the space.
